

ABSTRACT

A jaw crusher bucket (50) for attaching to a front-end loader or excavator has a plurality of rock and concrete splitting teeth (56), and jaw means (52, 54) for crushing any large pieces of rubble split from the rock or concrete into smaller pieces. There is a stationary jaw (52) which supports the teeth (56), and a pivotally movable jaw (54) which is able to move by a hydraulic ram (67) to cause the movable jaw (54) to be urged towards the stationary jaw (52) and so crush the rubble.
